M1.1- Reflection Paper

Goal

As an urban designer with keen interest in sustainable development, I wish to explore future mobility by means of technology, especially on autonomous, electrical and shared vehicles. When it comes to the relationship between mobility technology and urban infrastructure, a revitalization of vehicle forms, streets and community space is expected. Also, UX in MaaS should be upgraded.

Takeaway

The most exciting part is the 24-step disciplined entrepreneurship! In this process, I aspire to delve deep into the creation with team cooperation to finally solve real world challenges.

Entrepreneurship persona

Hipster, meaning design and user experience.

Identification

Among hustler, hacker and hipster, I identify most closely with the last one. Due to my major in architecture and urban design, I could indeed realize the importance of human-oriented interaction. With solid technology (hacker), the successful design product (hipster) is the key to win popularity and accelerate marketing and business (hustler).

Reactions to Antifragility

The concept of Antifragility, proposed by Nassim Taleb, refers to a sensitivity and positive response to disorder. In entrepreneurship, antifragile skills such as 1) persistence in dilemma, risk management; 2) network connection, making most use of resources when encountering opportunities; and 3) creative enough to tackle challenges, promote success in a black swan event.
